

1 BACKGROUND OF THE INVENTION

2 Field of the Invention:

3 The present invention relates to a system and method for accessing servers of domains and  
4 URLs by a computer of a user on the Internet. More particularly, the present invention relates to a  
5 method and system for accessing servers of acceptable domains and acceptable URLs by a computer  
6 of a user on the Internet.

7 Description of the Prior Art:

8 The Internet is a large computer network. The World Wide Web (WWW) was designed to  
9 allow a computer user, using a client program, to view files located on server computers throughout  
10 the Internet.

11 A file is accessed through the computer user's Internet connection and returned thereto and  
12 displayed on the web browser thereof. A WWW HTML (hyper-text mark-up language) document  
13 is normally viewed by selecting a file located on a server computer that is accessed by requesting the  
14 address of the file, the Uniform Resource Locator (URL).

15 A URL is usually accessed by entering a group of characters in an appropriate field in a web  
16 browser. The URL request is processed by the web browser and the file is located on the Internet

1 utilizing IP. Frequently accessed web pages, however, may be assigned to an icon or to a list  
2 contained within the web browser.

3 Files written in Hyper Text Mark-Up language are known as Hypertext documents and  
4 viewing these files is accomplished using the web browser. Hypertext links are another method of  
5 finding an appropriate file for viewing. Web pages in HTML allow a user viewing a web page to  
6 "click" on certain text or on a certain image and thereby request the underlying URL of another web  
7 page.

8 The Internet is organized so that every computer thereon has its own identifying numerical  
9 address. Transmission Control Protocol and Internet Protocol (TCP/IP) allow computers on the  
10 Internet to communicate with, and to find correct locations of, each other. The numerical address  
11 of each computer is referred to as the IP address. The URL consists of a protocol, a domain name  
12 associated with an IP address, and a file name.

13 The system whereby a name is assigned to the computer number is the Domain Name  
14 System. Names are used as a mnemonic alternative to a numerical IP address. A Domain Name  
15 consists of a number of elements designed to correspond to an IP address. The elements of a  
16 Domain Name consist of a top level domain and may include second, third, and fourth level  
17 domains. By knowing the correct domain name a computer may gain access to any computer located  
18 on the WWW.

1           Organizations that are by necessity obligated to provide computers in public areas often find  
2           that the open nature of the Internet allows an individual to use the computer to access material that  
3           is not consistent with the organization's goals. Access restriction is therefore required and may be  
4           accomplished by a variety of methods.

5           One such method is to establish a tabular listing of acceptable URLs. The selection of web  
6           sites is then accomplished by selecting from a list of hypertext links. This method requires  
7           maintaining a current list of the desired web sites for the user's access.

8           Another approach is to provide access permission based on a user authorization level and  
9           rating the contents of individual web sites. This approach necessitates assigning an authorization  
10          level based on parameters that an individual may choose not to divulge. Also, web page ratings must  
11          be continually reviewed to remain current. Both aspects, assigning an authorization level and  
12          assigning a rating to individual web pages may require resources that are not available to a given  
13          organization. Additionally, this approach necessitates that the organization responsible respond to  
14          changes in a user's authority level in a timely manner to prevent inappropriate restriction to an  
15          acceptable web site.

16          Filtering services are offered as another approach to limiting access to information found on  
17          the WWW. Generally directed towards filtering pornography and violence, these services normally  
18          charge a monthly fee. A filtering service may apply its standards to any given web site.

1 Problems associated with the above methods of limiting access are that a large amount of  
2 resources are required to start and maintain the number of web sites allowed to a given user.  
3 Another is that due to the changing nature of the Internet, new web sites are being added all the time  
4 and they must be subjected to review on a continual basis.

5 Numerous innovations for Internet information systems have been provided in the prior art  
6 that will be described infra. Even though these innovations may be suitable for the specific  
7 individual purposes to which they address, however, they differ from the present invention.

8 FOR EXAMPLE, United States Patent Number 5,717,913 to Driscoll teaches an Information  
9 Filtering (IF) system for retrieving relevant text data from a data base document collection. A user  
10 can use this system to access a dynamic data stream to retrieve relevant data such as accessing e-mail  
11 or a wire-service. Alternatively, a user can use the IF system to access a data storage archive such  
12 as electronically stored patents, journals and the like. The invention includes several steps. The first  
13 step has a user reduce the information they are interested in into a tangible form such as manually  
14 writing a natural language user need statement, or alternatively inputting the statement electronically  
15 into a computer file for storage. The next step is to create a filter window having an adjustable  
16 document viewing text length, that will be used to electronically scan through the database collection  
17 of documents in order to determine a relevancy value for each scanned document. The filter can be  
18 created several ways using synonym and domain lists. Alternatively, the synonym and lists for each  
19 document can be determined by Entity-Relationship (ER) modelling to generate a search schema.  
20 After documents receive relevancy values, the user is free to view only those documents having  
21 relevancy values that exceed a preselected threshold value. Documents can be ranked from most

1 relevant to least relevant. Feedback information from viewing the retrieved documents can be used  
2 to update the synonym/domain lists of the filtering window to enhance the relevance retrieval of  
3 subsequent documents.

4 ANOTHER EXAMPLE, United States Patent Number 5,787,254 to Maddalozzo, Jr. et al.  
5 teaches a browser extension method and system for a Web browser in a computer network having  
6 a client connectable to one or more servers, the client having an interface for displaying a first  
7 hypertext document with one or more hypertext links to a second hypertext document located at a  
8 server. Initially, an access parameter indicating a selected parameter which describes an access to  
9 another hypertext document is associated with a hypertext link. Thereafter, the hypertext link to the  
10 second hypertext document is selected in response to user input. Next, an access time period is  
11 initiated, during which the hypertext link accesses the second hypertext document, in response to the  
12 selection of the hypertext document. Thereafter, the access parameter is displayed in response to  
13 initiating the access time period, permitting a user to review the access parameter.

14 STILL ANOTHER EXAMPLE, United States Patent Number 5,802,518 to Karaev et al.  
15 teaches a secure electronic distribution of research documents over the world wide web to investors  
16 who are authorized to receive the research documents. A repository server receives research  
17 documents from contributors. Also received are corresponding document profiles with information  
18 relating to each research document including authorization information specifying who is permitted  
19 to access each research document. The repository server includes a first database for structured  
20 query searches and a second database for full text searches. A web server is coupled to the  
21 repository server and coupled to the world wide web. The web server receives requests from

1 investors for research documents that satisfy a query. The web server determines whether the first  
2 database or the second database should be searched based upon the type of query. The repository  
3 server transmits to the web server a list of research documents that satisfy the query and which the  
4 investor is authorized to access according to the authorization information. The web server formats  
5 the list of documents according to a template form. Optionally, queries can be optimized. The  
6 system has a control mechanism to prevent concurrent unauthorized access by two people using the  
7 same ID/password combination.

12  
13  
14  
15  
16  
17  
YET ANOTHER EXAMPLE, United States Patent Number 5,920,859 to Li teaches a search  
engine for retrieving documents pertinent to a query indexes documents in accordance with  
hyperlinks pointing to those documents. The indexer traverses the hypertext database and finds  
hypertext information including the address of the document the hyperlinks point to and the anchor  
text of each hyperlink. The information is stored in an inverted index file, which may also be used  
to calculate document link vectors for each hyperlink pointing to a particular document. When a  
query is entered, the search engine finds all document vectors for documents having the query terms  
in their anchor text. A query vector is also calculated, and the dot product of the query vector and  
each document link vector is calculated. The dot products relating to a particular document are  
summed to determine the relevance ranking for each document.

18  
19  
20  
21  
STILL YET ANOTHER EXAMPLE, United States patent Number 5,933,832 to Suzuoka  
et al. teaches a retrieval system for performing database retrieval in response to a retrieval request  
that includes a database preparing means for collecting corresponding data to prepare a database  
under at least a condition that an update frequency range of data serving as a target for index table

1 generation is uniquely assigned to the database, and an update frequency of data falls within the  
2 assigned update frequency range, or a mean update frequency of a data group to which the data  
3 belongs falls within the assigned update frequency range.

4 YET STILL ANOTHER EXAMPLE, United States Patent number 5,953,732 to Meske, Jr.  
5 et al teaches a computer-implemented method and system for retrieving information. A first file of  
6 information is received which includes a first markup language to identify contents of the  
7 information. Responsive to receiving the first file of information, the first file of information is  
8 parsed to generate a list of profiles, and at least one corresponding topic for each of the list of  
9 profiles. A second file in a second markup language is created containing the list of the profiles and  
10 at least one corresponding third file is created in a third markup language for the at least one  
11 corresponding topic for each of the list of profiles. The second file contains anchors referencing each  
12 at least one corresponding third file, and first markup instances in the first file of information are  
13 converted to second markup instances in either the second file or the third file. The first file of  
14 information is parsed to determine the at least one article, if any, for each of the at least one  
15 corresponding top for the each of the list of profiles, and a corresponding brief for the at least one  
16 article. A fourth file and a fifth file are generated for the at least one article, if any, for each of the  
17 at least one corresponding topic for each of the list of profiles. The fourth file includes a brief of  
18 each of the at least one article in the first file of information and an anchor to the fifth file, the fifth  
19 file including text for the at least one article, if any, for each of the at least one corresponding topic  
20 for each of the list of profiles. In implemented embodiments, a sixth file can also be created which  
21 contains a plurality of anchors referencing a plurality of the fifth files, where in the anchors in the  
22 sixth file are arranged by each of the profile and corresponding topic. The first file of information  
23 can include receiving an electronic mail (e-mail) message.

24 STILL YET ANOTHER EXAMPLE, United States Patent Number 5,978,828 to Greer et al.  
25 teaches an apparatus and method of providing notification of a content change of a web page. The

1 method includes the steps of transmitting a request from a first electronic system to a second  
2 electronic system for a quotient value indicative of the content change, transmitting the quotient  
3 value from the second electronic system to the first electronic system, comparing the quotient value  
4 to a predetermined value to determine whether a threshold is triggered, and notifying the first  
5 electronic system of the content change if the threshold is triggered.

6 YET STILL ANOTHER EXAMPLE, United States Patent Number 6,112,202 to Kleinberg  
7 a system and method for searching for desired items from a network of information resources. In  
8 particular, the system and method have advantageous applicability to searching for World Wide Web  
9 pages having desired content. An initial set of pages are selected, preferably by running a  
10 conventional keyword-based query, and then further selecting pages pointing to, or pointed to from,  
11 the pages found by the keyword-based query. Alternatively, the invention may be applied to a single  
12 page, where the initial set includes pages pointed to by the single page and pages which point to the  
13 single page. Then, iteratively, authoritativeness values are computed for the pages of the initial set,  
14 based on the number of links to and from the pages. One or more communities, or "neighborhoods,"  
15 of related pages are defined based on the authoritativeness values thus produced. Such communities  
16 of pages are likely to be of particular interest and value to the user who is interested in the keyword-  
17 based query or the single page.

18 STILL YET ANOTHER EXAMPLE, United States Patent Number 6,139,177 to  
19 Venkatraman et al. teaches a web access functionality embedded in a device that includes modules  
20 for generating a device web page wherein the device web page enables selection of at least one  
21 control function for the device. The web access functionality also includes modules for accessing  
22 the device web page via a communication path such that a user of a web browser accesses the control  
23 function for the device through the device web page. The control function includes control functions  
24 for loading new information into the device via the communication path and control functions for

1 providing notification messages via the communication path upon the occurrence of events in the  
2 device.

3 YET STILL ANOTHER EXAMPLE, United States Patent Number 6,145,000 to Stuckman  
4 et al. teaches a method and system for creating and navigating linear hypermedia resource programs.  
5 The system includes a distributed hypermedia resource network having a plurality of hypermedia  
6 resources residing on one or more remote information nodes. A common remote information node  
7 is in communication with a subscriber station and the remote information nodes in the distributed  
8 network. The common remote information node contains at least one linear hypermedia resource  
9 program consisting of pre-selected media elements from one or more hypermedia resources linked  
10 with exclusive linear links, each media element in the linear program having only one forward link  
11 to the next media element. The method includes the steps of downloading and displaying a media  
12 element in the linear program and responding to user commands to download and display the next  
13 media element in the linear program.

14 It is apparent that numerous innovations for Internet information systems have been provided  
15 in the prior art that are adapted to be used. Furthermore, even though these innovations may be  
16 suitable for the specific individual purposes to which they address, however, they would not be  
17 suitable for the purposes of the present invention as heretofore described.

1 SUMMARY OF THE INVENTION

2 ACCORDINGLY, AN OBJECT of the present invention is to provide a system and method  
3 for accessing servers of acceptable domains and acceptable URLs by a computer of a user on the  
4 Internet that avoids the disadvantages of the prior art.

5 ANOTHER OBJECT of the present invention is to provide a system and method for  
6 accessing servers of acceptable domains and acceptable URLs by a computer of a user on the Internet  
7 that is simple to use.

8 BRIEFLY STATED, STILL YET ANOTHER OBJECT of the present invention is to provide  
9 a system and method for accessing servers of acceptable domains and acceptable URLs by a  
10 computer of a user on the Internet. The system includes a web browser configured to have contained  
11 therewithin a list of the acceptable domains and a database listing at least one of the acceptable  
12 URLs. The web browser has a requested URL enterable therein by the user, either directly or by way  
13 of a homepage thereof, and once entered, determines if the requested URL is in the list of the  
14 acceptable domains, and if so, accesses the server associated with the requested URL, and if not,  
15 determines if the requested URL is listed in the database, and if so, accesses the server associated  
16 with the requested URL, and if not, displays on the computer of the user a "requested URL is not  
17 accessible" message.

18 The novel features which are considered characteristic of the present invention are set forth  
19 in the appended claims. The invention itself, however, both as to its construction and its method of  
20 operation, together with additional objects and advantages thereof, will be best understood from the  
21 following description of the specific embodiments when read and understood in connection with the  
22 accompanying drawing.

BRIEF DESCRIPTION OF THE DRAWING

The figures of the drawing are briefly described as follows:

FIGURES 1A-1P are a block diagram of the system of the present invention; and

FIGURES 2A-2N are a flow chart of the method of the present invention.

099390" 82316860

1                                    DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

2                    Referring now to the figures, in which like numerals indicate like parts, and particularly to  
3                    FIGURES 1A-1P, which are a block diagram of the system of the present invention, the system of  
4                    the present invention is shown generally at 10 for accessing servers 12 of acceptable domains 14 and  
5                    acceptable URLs 16 by a computer 18 of a user 20 on the Internet 22.

6                    The system 10 comprises a web browser 24 configured, by a system administrator 26, to have  
7                    contained therewithin a list of the acceptable domains 14 and a database 30 listing at least one of the  
8                    acceptable URLs 16.

9                    The web browser 24 has a requested URL 32 enterable therein by the user 20, and once  
10                    entered, the web browser 24 determines if the requested URL 32 is in the list of the acceptable  
11                    domains 14, and if so, the web browser 24 accesses the server 12 associated with the requested URL  
12                    32, and if not, the web browser 24 determines if the requested URL 32 is listed in the database 30,  
13                    and if so, the web browser 24 accesses the server 12 associated with the requested URL 32, and if  
14                    not, the web browser 24 displays on the computer 18 of the user 20 a "requested URL is not  
15                    accessible" message 36.

16                    The web browser 24 further contains a homepage 38 having a URL 40 selected from the  
17                    acceptable URLs 16 listed in the database 30.

18                    The requested URL 32 is entered by way of one of directly into the web browser 24 and into  
19                    the homepage 28 of the web browser 24.

20                    When the requested URL 32 is entered into the homepage 38 of the web browser 24, the  
21                    requested URL is entered by typing the requested URL 32 on the homepage 38 thereof, clicking on

1 an icon 42 displayed on the homepage 38 thereof and being representative of the requested URL 32,  
2 and choosing from a list of favorite URLs 46 displayable on the homepage 38 thereof.

3 The requested URL 32 is entered into the web browser 24 by one of typing the requested  
4 URL 32 on the homepage 38 thereof, clicking on an icon 42 displayed on the homepage 38 thereof  
5 and being representative of the requested URL 32, and choosing from a list of favorite URLs 46  
6 displayable on the homepage 38 thereof.

7 The system 10 further comprises a temporary database 48, configured by the system  
8 administrator 26, contained in the web browser 24, and containing a list of additional acceptable  
9 URLs 50 that the web browser 24 checks the requested URL 32 against if the requested URL 32 is  
10 not listed in the database 30, and if the requested URL 32 is listed in the temporary database 48, the  
11 web browser 24 accesses the server 12 associated with the requested URL 24.

12 The system 10 further comprises a web browser download site 54 being logged onto by the  
13 system administrator 26 from one of the computer 18 of the user 20 and from any computer 56 other  
14 than the computer 18 of the user 20 having a normal web browser 58, and once logged thereon,  
15 allows access to the computer 18 of the user 20.

16 The web browser download site 54 allows one of downloading the web browser 24 into the  
17 computer 18 of the user 18, downloading the temporary database 48 into the web browser 24 in the  
18 computer 18 of the user 20, revising at least one of the list of the acceptable domains 14, the database  
19 30, and the temporary database 48 by utilizing software 60 already contained in the web browser 24,  
20 checking for corrupt web browser software 62 in the computer 18 of the user 20, and placing cookies  
21 64 into the computer 18 of the user 20.

1           The method 70 for accessing the servers 12 of the acceptable domains 14 and the acceptable  
2 URLs 16 by the computer 18 of the user 20 on the Internet 22 can best be seen in FIGURES 2A-2N,  
3 which are a flow chart of the method of the present invention, and as such, will be discussed with  
4 reference thereto.

5           The method 70 for accessing the servers 12 of the acceptable domains 14 and the acceptable  
6 URLs 16 by the computer 18 of the user 20 on the Internet 22 comprises the following steps:

7           STEP 1:       Configure, by the system administrator 26, the web browser 24 having contained  
8                           therewithin the list of the acceptable domains 14 and the database 30 listing at least  
9                           one of the acceptable URLs 16, wherein the web browser 24 has the homepage 38  
10                          with the URL 40 selected from the acceptable URLs 16 listed in the database 30.

11           STEP 2:       Log onto, by the system administrator 26, the web browser download site 54 from  
12                           one of the computer 18 of the user 20 and any computer 56 other than the computer  
13                           18 of the user 20 having the normal web browser 58.

14           STEP 3:       Download, by the system administrator 26, the web browser 24 into the computer 18  
15                           of the user 20 so as to form a downloaded web browser 72.

16           STEP 4:       Check, during downloading, for corrupt web browser software 62.

17           STEP 5:       Place, during downloading, at least one of cookies 64 and other information 74 into  
18                           the computer 18 of the user 20.

19           STEP 6:       Determine if the temporary database 48 containing the list of additional acceptable  
20                           URLs 50 is to be configured.

1            STEP 7:        Proceed directly to STEP 11, if answer to STEP 6 is no.

2            STEP 8:        Configure, by the system administrator 26, the temporary database 48, if answer to

3            STEP 6 is yes.

4            STEP 9:        Log onto, by the system administrator 26, the web browser download site 54 from

5            one of the computer 18 of the user 20 and the any computer 56 other than the

6            computer 18 of the user 20 having the normal web browser 58.

STEP 10:       Download, by the system administrator 26, the temporary database 48 into the

             downloaded browser 72 in the computer 18 of the user 20.

STEP 11:       Enter, by the user 20, the requested URL 32 into the downloaded browser 72 by way

             of one of directly into the downloaded browser 72 and inot the homepage 38 of the

             downloaded browser 72, wherein when the requested URL 32 is entered inot the

             homepage 38 of the downloaded web browser 72, the requested URL 32 is entered

             by one of typing the requested URL 32 onto the homepage 38, clicking on the icon

             42 displayed on the homepage 38 and being representative of the requested URL 32,

             and choosing from the list of favorite URLs 46 displayable on the homepage 38.

16           STEP 12:        Determine, by the downloaded web browser 72, if the requested URL 32 is in the list

17           of the acceptable domains 14.

18           STEP 13:        Proceed directly to STEP 20, if answer to STEP 12 is yes.

1        STEP 14:       Determine, by the downloaded web browser 72, if the requested URL 32 is listed in  
2                               the database 30 contained in the downloaded web browser 72, if answer to STEP 12  
3                               is no.

4        STEP 15:       Proceed directly to STEP 20, if answer to STEP 14 is yes.

5        STEP 16:       Determine, by the downloaded web browser 72, if the temporary database 48 exists,  
6                               and if so, determine, by the downloaded web browser 72, if the requested URL 32 is  
7                               listed in the temporary database 48, if answer to STEP 14 is no.

8        STEP 17:       Proceed directly to STEP 20, if answer to STEP 16 is yes.

9        STEP 18:       Display, by the downloaded web browser 72, on the computer 18 of the user 20, the  
10                               "requested URL is not accessible" message 36, if answer to STEP 16 is no.

11       STEP 19:       Return directly to STEP 11, if STEP 18 is carried out.

12       STEP 20:       Access, by the downloaded web browser 72, the server 12 associated with the  
13                               requested URL 32.

14       STEP 21:       Determine if the database 30 in the downloaded web browser 72 is to be revised.

15       STEP 22:       Log onto, by the system administrator 26, the web browser download site 54 from  
16                               one of the computer 18 of the user 20 and the any computer 56 other than the  
17                               computer 18 of the user 20 having the normal web browser 58, if answer to STEP 21  
18                               is yes.

1            STEP 23:      Revise remotely, by the system administrator 26, at least one of the list of the  
2                            acceptable domains 16 and the database 30 contained in the downloaded web  
3                            browser 72 by utilizing software 60 already contained in the downloaded web  
4                            browser 72.

5                        It will be understood that each of the elements described above, or two or more together, may  
6                        also find a useful application in other types of constructions differing from the types described  
7                        above.

8                        While the invention has been illustrated and described as embodied in a system and method  
9                        for accessing acceptable servers of URLs and acceptable domains by a computer of a user on the  
10                        Internet, however, it is not limited to the details shown, since it will be understood that various  
11                        omissions, modifications, substitutions and changes in the forms and details of the device illustrated  
12                        and its operation can be made by those skilled in the art without departing in any way from the spirit  
13                        of the present invention.

14                        Without further analysis, the foregoing will so fully reveal the gist of the present invention  
15                        that others can, by applying current knowledge, readily adapt it for various applications without  
16                        omitting features that, from the standpoint of prior art, fairly constitute characteristics of the generic  
17                        or specific aspects of this invention.
